

Open Source Job Portal

Project Report

1. Introduction

The Open Source Job Portal is a comprehensive web application designed to connect job seekers with potential employers. This project serves as a dynamic platform where employers can post job openings, manage applications, and seekers can browse and apply for available roles tailored to their expertise.

2. Technologies Used

- Frontend: HTML5, CSS3 (Custom Variables, Flexbox/Grid), Vanilla JS (Fetch API).
- Backend: Node.js, Express.js (RESTful API architecture).
- Database: SQLite database for robust, local data persistence.
- Security & Auth: express-session for stateful session management, bcryptjs for secure password hashing.

3. Core Features

- Authentication System: Secure registration and login workflows with distinct roles (Job Seeker / Employer).
- Job Management: Employers can effortlessly create, view, and manage their job postings from a centralized dashboard.
- Application Workflow: Seekers can browse jobs, apply directly through the portal, and track application statuses.
- Search & Filtering: Robust client-side filtering capabilities to locate specific jobs by keyword or type.
- Responsive UI: A modern, intuitive interface that seamlessly adapts to different screen sizes and devices.

4. Conclusion

This project successfully demonstrates the integration of a responsive frontend design with a robust backend API and SQLite database system. By fulfilling all the core functional requirements from user authentication to job listing management, the Open Source Job Portal stands as a complete, fully functional dynamic web application.
